Devin Review: AI to Stop Slop

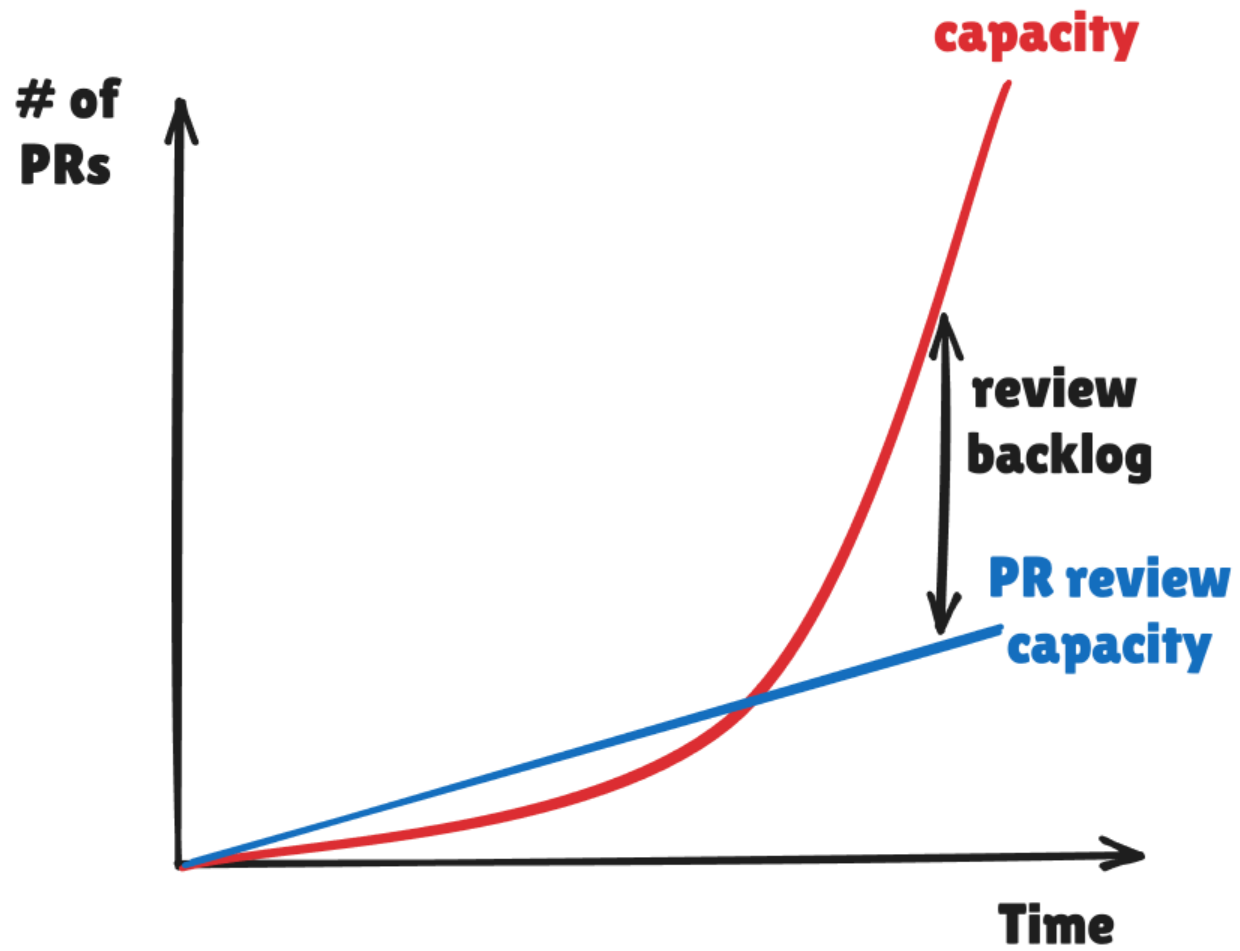

By The Cognition Team

IN THIS ARTICLE:

[The Birth and Stagnation of Code Review](#)[The Modern Code Review Workflow](#)

As coding agents proliferate, the # of PRs increases, but the quality of that code can be mixed, and the size of each PR is increasing past maintainers' ability to understand. We're hearing from our customers that **code review—not code generation—is now the bottleneck to shipping great products.**

That's why we built Devin Review, a code review tool that **uses state-of-the-art AI + UX to scale human understanding of ever-more-complex code diffs**—whether authored by a human, or an agent.

Was this intentional?

technoweenie [repo collab](#) 1 day ago

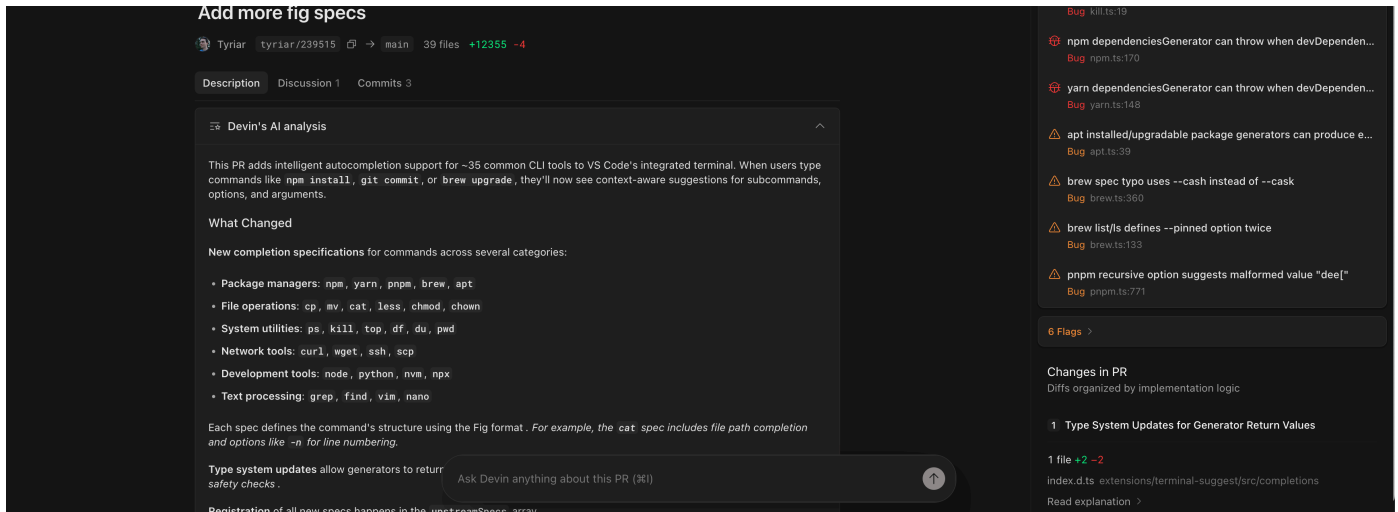

That should be fine. That's the dev-only version of asset_hijack. Running it through `parse_html` ensures it at least goes through nokogiri. I'm not sure how this benefits the change though... maybe it's cleaning up bad HTML?

Add a line note

More broadly, the feeling that people have of extreme productivity with coding agents in their vibecoded prototypes, vs the disappointing feeling that most people actually see in the useful output of their engineers, organizations, and experience as end users, is the great mystery of our time.

To paraphrase Winston Churchill: "Never in the field of software engineering has so much code been created by so many, yet shipped to so few."

Add more fig specs

Description · Discussion 1 · Commits 3

Devin's AI analysis

This PR adds intelligent autocompletion support for ~35 common CLI tools to VS Code's integrated terminal. When users type commands like `npm install`, `git commit`, or `brew upgrade`, they'll now see context-aware suggestions for subcommands, options, and arguments.

What Changed

New completion specifications for commands across several categories:

- Package managers: `npm`, `yarn`, `pnpm`, `brew`, `apt`
- File operations: `cp`, `mv`, `cat`, `less`, `chmod`, `chown`
- System utilities: `ps`, `kill`, `top`, `df`, `du`, `pwd`
- Network tools: `curl`, `wget`, `ssh`, `scp`
- Development tools: `node`, `python`, `nvim`, `npx`
- Text processing: `grep`, `find`, `vim`, `nano`

Each spec defines the command's structure using the Fig format. For example, the `cat` spec includes file path completion and options like `-n` for line numbering.

Type system updates allow generators to return safety checks. Ask Devin anything about this PR (#1)

Registration of all new specs happens in the `unstreamSpecs` array.

Read explanation

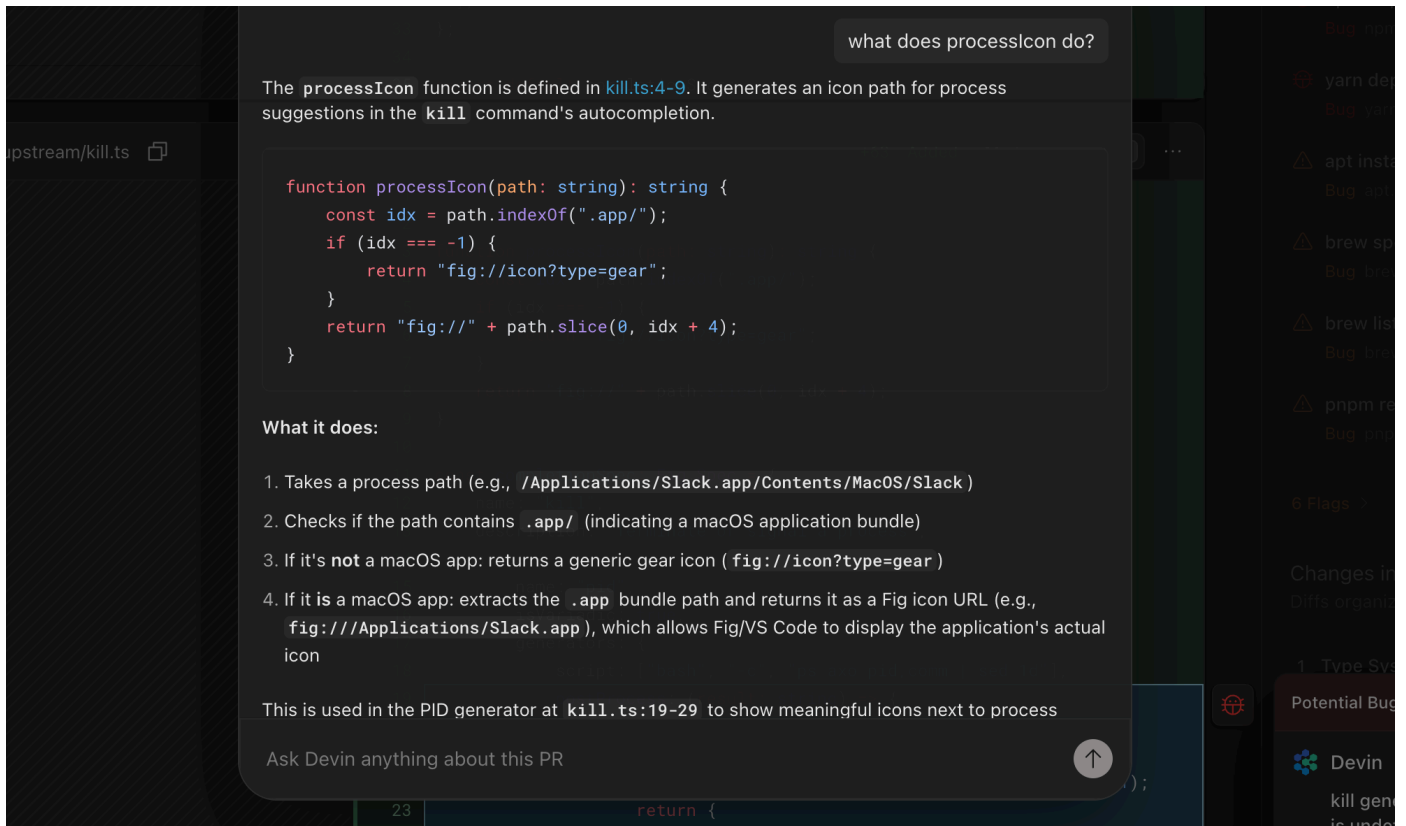

Devin Review adds AI tooling to help you scale your PR understanding, so you quickly and fully understand the code you are about to merge.

As you review the PR, Devin helps you in every step:

Reading better:

GitHub shows you diffs by alphabetical order.

Solution: intelligent diff organization. PR Review analyzes your code, groups together

what does processIcon do?

The `processIcon` function is defined in `kill.ts:4-9`. It generates an icon path for process suggestions in the `kill` command's autocomplete.

```
function processIcon(path: string): string {  
  const idx = path.indexOf(".app/");  
  if (idx === -1) {  
    return "fig://icon?type=gear";  
  }  
  return "fig://" + path.slice(0, idx + 4);  
}
```

What it does:

1. Takes a process path (e.g., `/Applications/Slack.app/Contents/MacOS/Slack`)
2. Checks if the path contains `.app/` (indicating a macOS application bundle)
3. If it's **not** a macOS app: returns a generic gear icon (`fig://icon?type=gear`)
4. If it **is** a macOS app: extracts the `.app` bundle path and returns it as a Fig icon URL (e.g., `fig:///Applications/Slack.app`), which allows Fig/VS Code to display the application's actual icon

This is used in the PID generator at `kill.ts:19-29` to show meaningful icons next to process

Catching bugs and issues

GitHub doesn't catch bugs in PRs; it relies on your CI/linting. Other bugcatchers in the market are often seen as spammy and low signal.
